

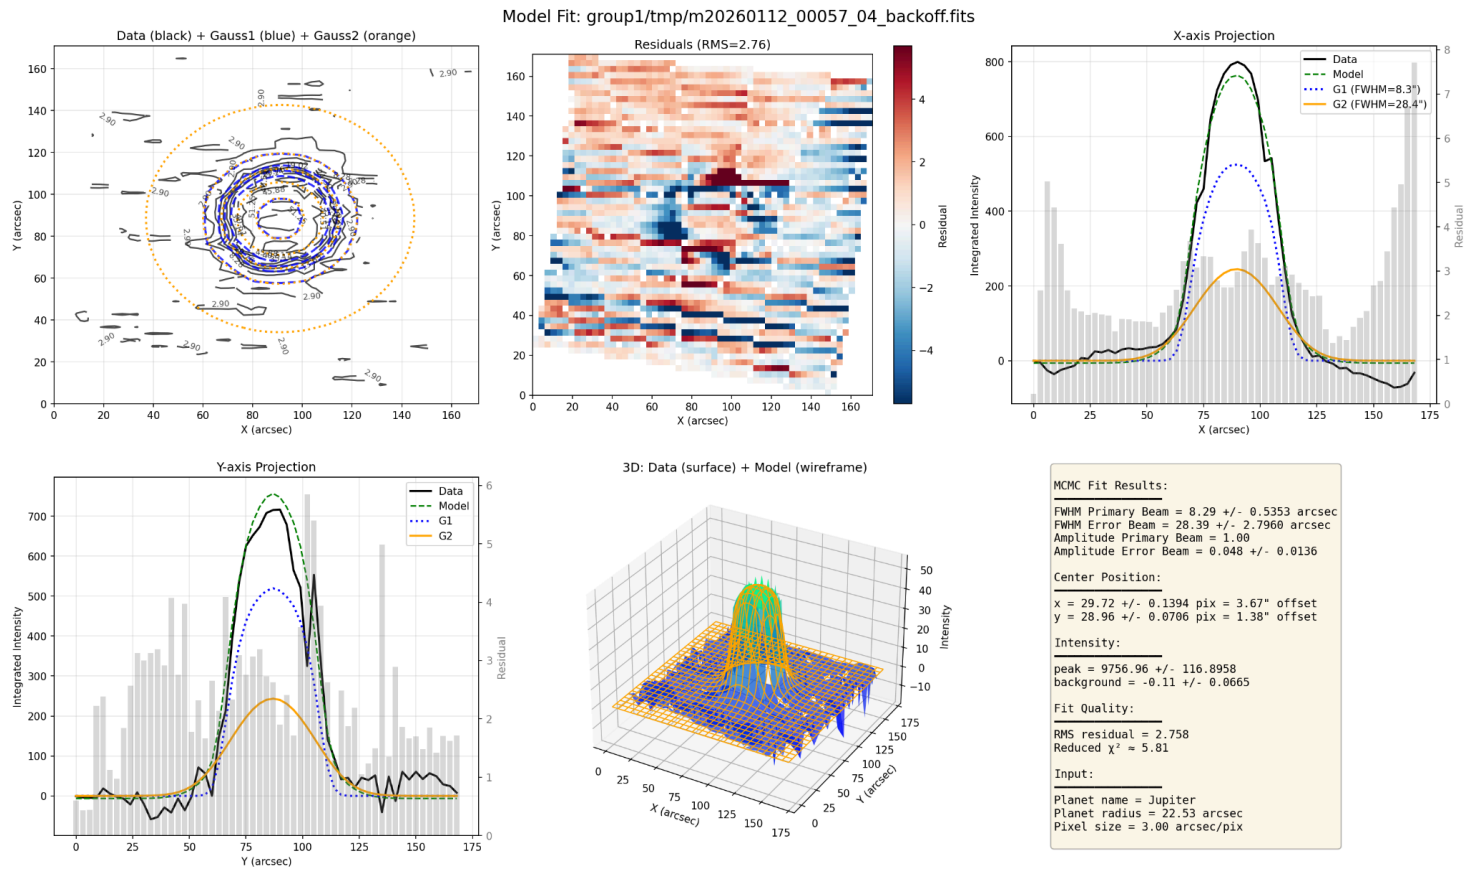

Figure 1. Example of the MCMC results for a single frequency measurement,. The model is shown in green and the data in black in the upper left, upper right and lower left panel. The top middle panel shows the residuals, calculated from subtracting the model to the data. The lower middle panel shows the 3D representation of the data and model. The lower right panel shows the numerical values of the results.

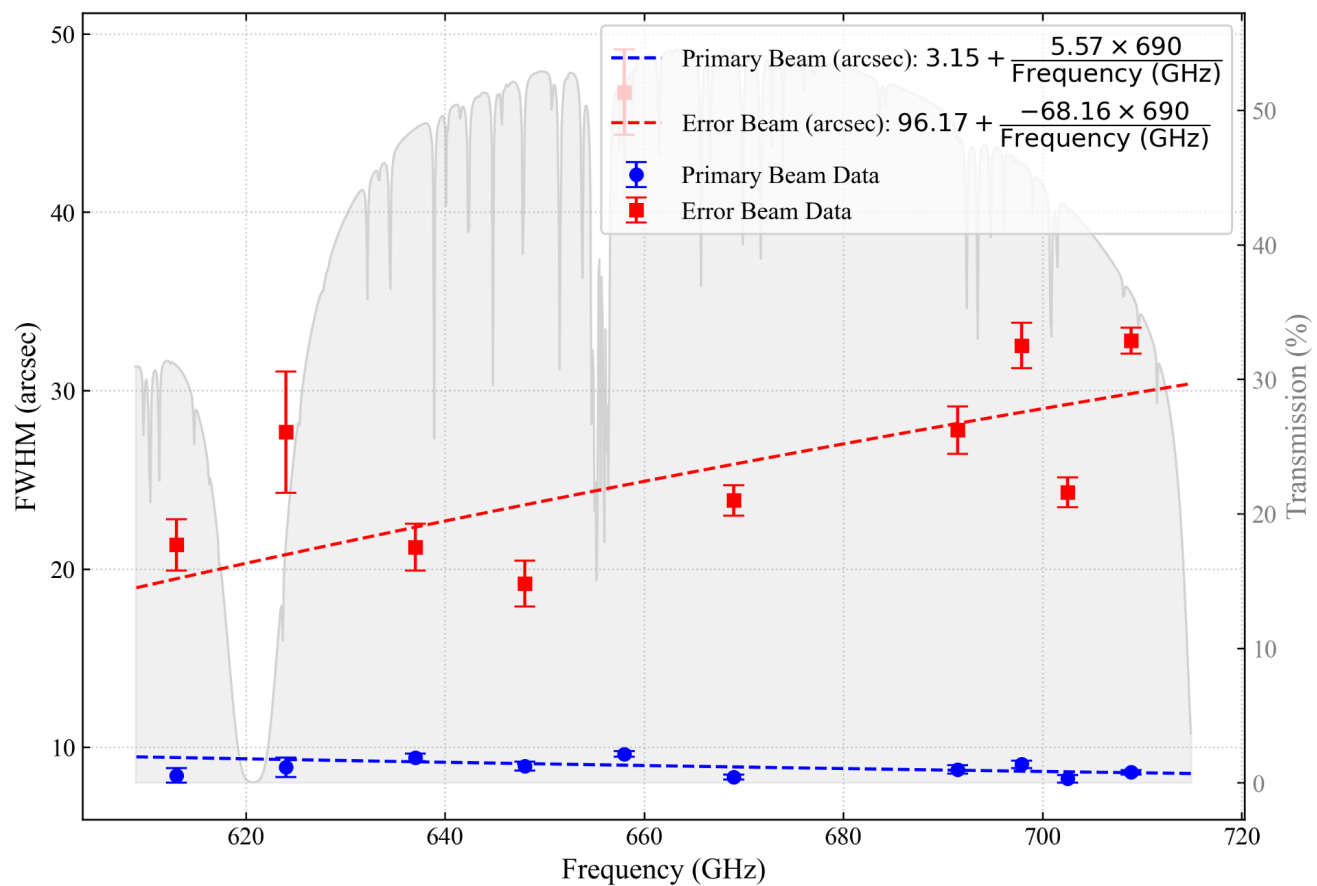

Figure 2. Beam Size measurement results. The blue and red data points represent the measurement of the primary and secondary beam. Their respective linear fits are presented as the dashed lines and their values in the figure inset. The grey right axis and plot in the background show the atmospheric transmission at Mauna Kea, showing the notable water vapor absorption lines.
